SEE A PLANET DURING THE DAY!

'SUP STARSHINES – LOOKING UP ISN'T JUST A NIGHTTIME ACTIVITY
– THIS WEEK YOU CAN SEE A PLANET DURING THE DAY!

HIT THE TWILIGHT AT 5AM BEFORE SUNRISE LOOKING EAST. THE
MORNING STAR - VENUS - WILL BE SHINING BRIGHTLY AHEAD OF
THE SUN.

ON THURSDAY, NOVEMBER 9 THE MOON JOINS VENUS. THEY'LL BE
WITHIN A DEGREE – ABOUT A PINKY WIDTH! WAKE UP EARLY AND
GET UP HIGH.

IF YOU WAIT AROUND AFTER SUNRISE AND KEEP TRACKING THE
MOON AND VENUS, YOU'LL JUST KEEP SEEING THEM! BECAUSE OF
THE CRESCENT PHASE, VENUS IS ACTUALLY BRIGHTER RIGHT
NOW – SO YOU SHOULD SEE IT FOR AT LEAST FEW HOURS.

THIS IS BECAUSE VENUS'S CLOUDS REFLECT A LOT OF LIGHT;
THEY'RE MOSTLY CARBON DIOXIDE WITH A SULFURIC ACID LAYER.
THIS MAKES THE SURFACE HOT AND DEADLY. IF WE WENT – IT
WOULDN'T BE PRETTY... BUT THE PLANET SURE LOOKS GREAT
HANGING IN THE SKY! FOLLOW THE MORNING STAR FOR THE REST
OF 2023! KEEP LOOKIN' UP
